

4<sup>th</sup> class

## Maths journal

Today something new I learned about angles.

I understand that a right angle is a horizontal and a vertical line. An obtuse is more than a right angle and an acute is less than a right angle. A straight angle is two right angles. Oblique lines are diagonal lines going to meet at the end. Parallel lines are two lines that will never meet. Vertical lines are straight lines going down. Horizontal lines are straight lines across.

Excellent!

This is how I would describe an acute angle to a third class it is less than and skinnier than a right angle.

Good girl, Aoife, but I would really love some diagrams to explain what you mean. Great work.
